VI BENEFITS ESTIMATES

This CAM rule does not itself have emissions reductions benefits. EPA does expect, however, that, because monitoring under CAM will give sources more information regarding compliance with emission standards, some sources may have to reduce emissions in order to comply with their underlying emissions standards. EPA expects that some emissions reductions may result from sources having to reduce emissions overall, and/or to respond to periods of excess emissions more quickly, thus reducing their frequency and duration. EPA has not estimated the emissions reductions that may result from this; EPA believes these reductions and any associated health and welfare benefits are not attributable to CAM — but to the underlying emissions standards.
